

Battery cabinet communication high voltage board

Overview

The BJB - RDBESS772BJBEVB is a battery junction box (BJB) reference design with electrical transport protocol link (ETPL) communication. This board contains two MC33772 battery sensors for redundant high voltage and current measurements and performs isolation measurements. Learn how this design improves protection, thermal control, and lowers manufacturing costs. NXP proposes scalable high voltage battery management system (HVBMS) reference. As a supplement to the high-voltage cable set, we offer high-voltage battery solutions that are responsible for power and data distribution within the battery. In addition, due to the high-voltage design of the BMS, insulation resistance measurement between the high-voltage domain and low-voltage domain is needed in order to catch defects in. The rapid adoption of high-voltage architectures in electric vehicles, particularly 800V platforms, has dramatically increased the demands on printed circuit board (PCB) technology. Each battery module is capable of monitoring up to 8 series 18650 Li-Ion batteries using the PAC1954.
