

Multiple old batteries

Overview

Let's suppose you have 3 different 12V batteries, wired in parallel to supply 12V power to your RV. They can have different capacities on account of size or age, but the same chemistry (e.g. all flooded lead acid or all AGM). Before you start charging, the voltage across each of them is the same—even if one is fully. There's absolutely no reason for an aged battery to be excluded from a battery for electrical reasons—only for space and weight would that make sense. Would a new. It's common in many RVs to make use of pairs of 6V deep cycle batteries wired in series. In a pair of 6V batteries in series, the voltages of each are not guaranteed to be. Ok, now we're talking about something a little different. In the case of a battery shorted cell, you'll be overcharging the other 5 cells in the same battery. They'll continue. One of the easiest ways to test individual battery capacity is with a portable analyzer. If you only have 12V batteries, they're pretty inexpensive, like [\[amazon_textlink\]](#).
