

What is a nickel-metal hydride battery

Overview

A nickel-metal hydride battery (NiMH or Ni-MH) is a type of rechargeable battery. The chemical reaction at the positive electrode is similar to that of the nickel-cadmium cell (NiCd), with both using nickel oxide hydroxide (NiOOH). However, the negative electrodes use a hydrogen-absorbing alloy. Work on NiMH batteries began at the -Geneva Research Center following the technology's invention in 1967. It was based on $Ti_2Ni + TiNi + x$ alloys and. A fully charged cell supplies an average 1.25 V/cell during discharge, declining to about 1.0–1.1 V/cell (further discharge may cause permanent damage). Consumer electronicsNiMH batteries have replaced NiCd for many roles, notably small rechargeable batteries. NiMH batteries. • • • • • The negative electrode reaction occurring in a NiMH cell is $H_2O + M + e \rightleftharpoons OH + MH$ On the positive electrode, nickel oxyhydroxide, $NiO(OH)$, is. When fast-charging, it is advisable to charge the NiMH cells with a smart to avoid, which can damage cells. Alkaline batteriesNiMH cells are often used in digital cameras and other high-drain devices, where over the duration of single-charge use they outperform.
